CALLING ALL UOFT STUDENTS:

**FILL OUT A QUICK  
SURVEY ON  
COMMUNITY FRIDGES  
FOR A CHANCE TO  
WIN 1 OF 4 \$25 GIFT  
CARDS**

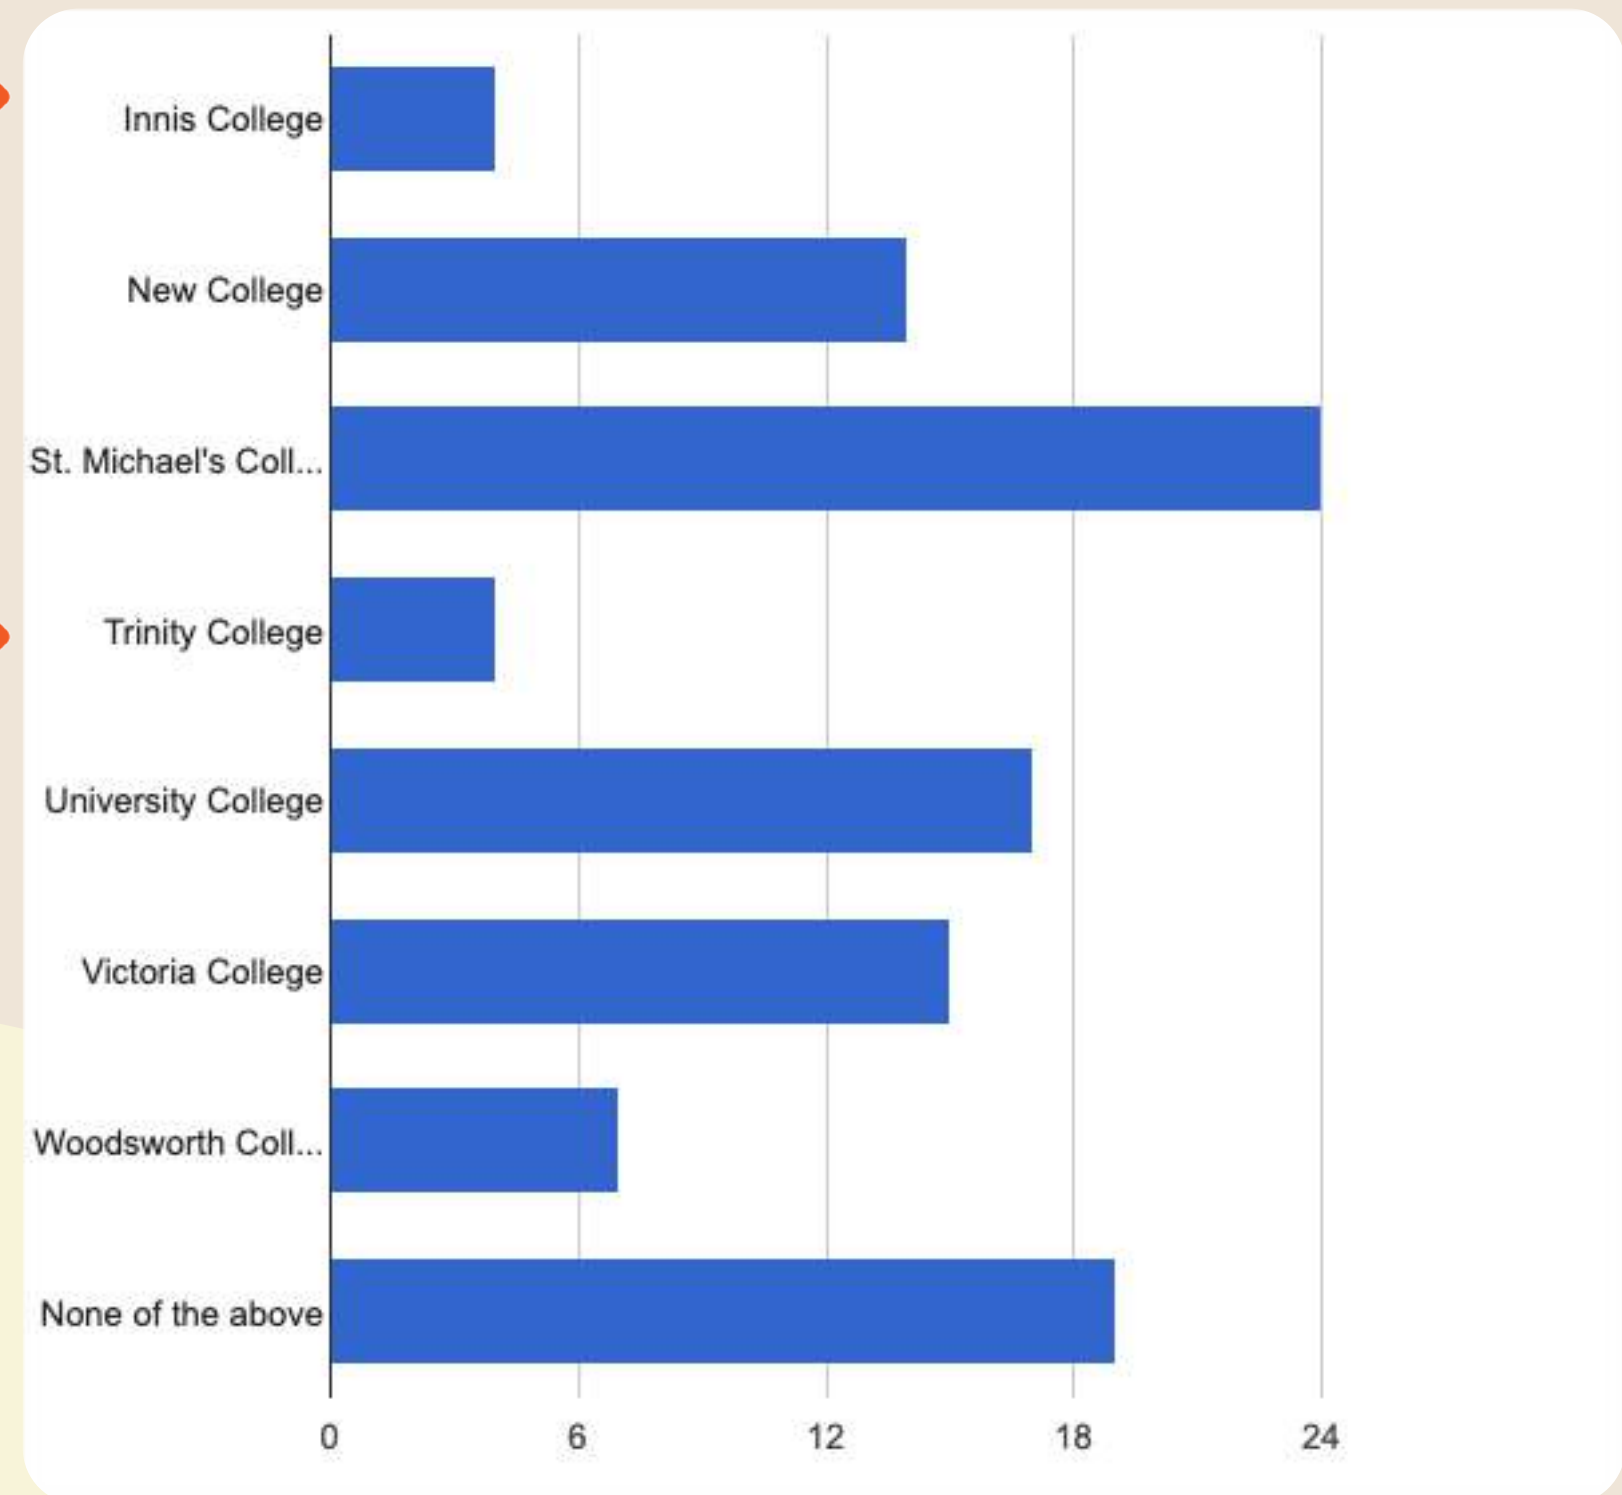

MUST BE A UOFT STUDENT TO PARTICIPATE

# Background Information

What year are you in your studies?

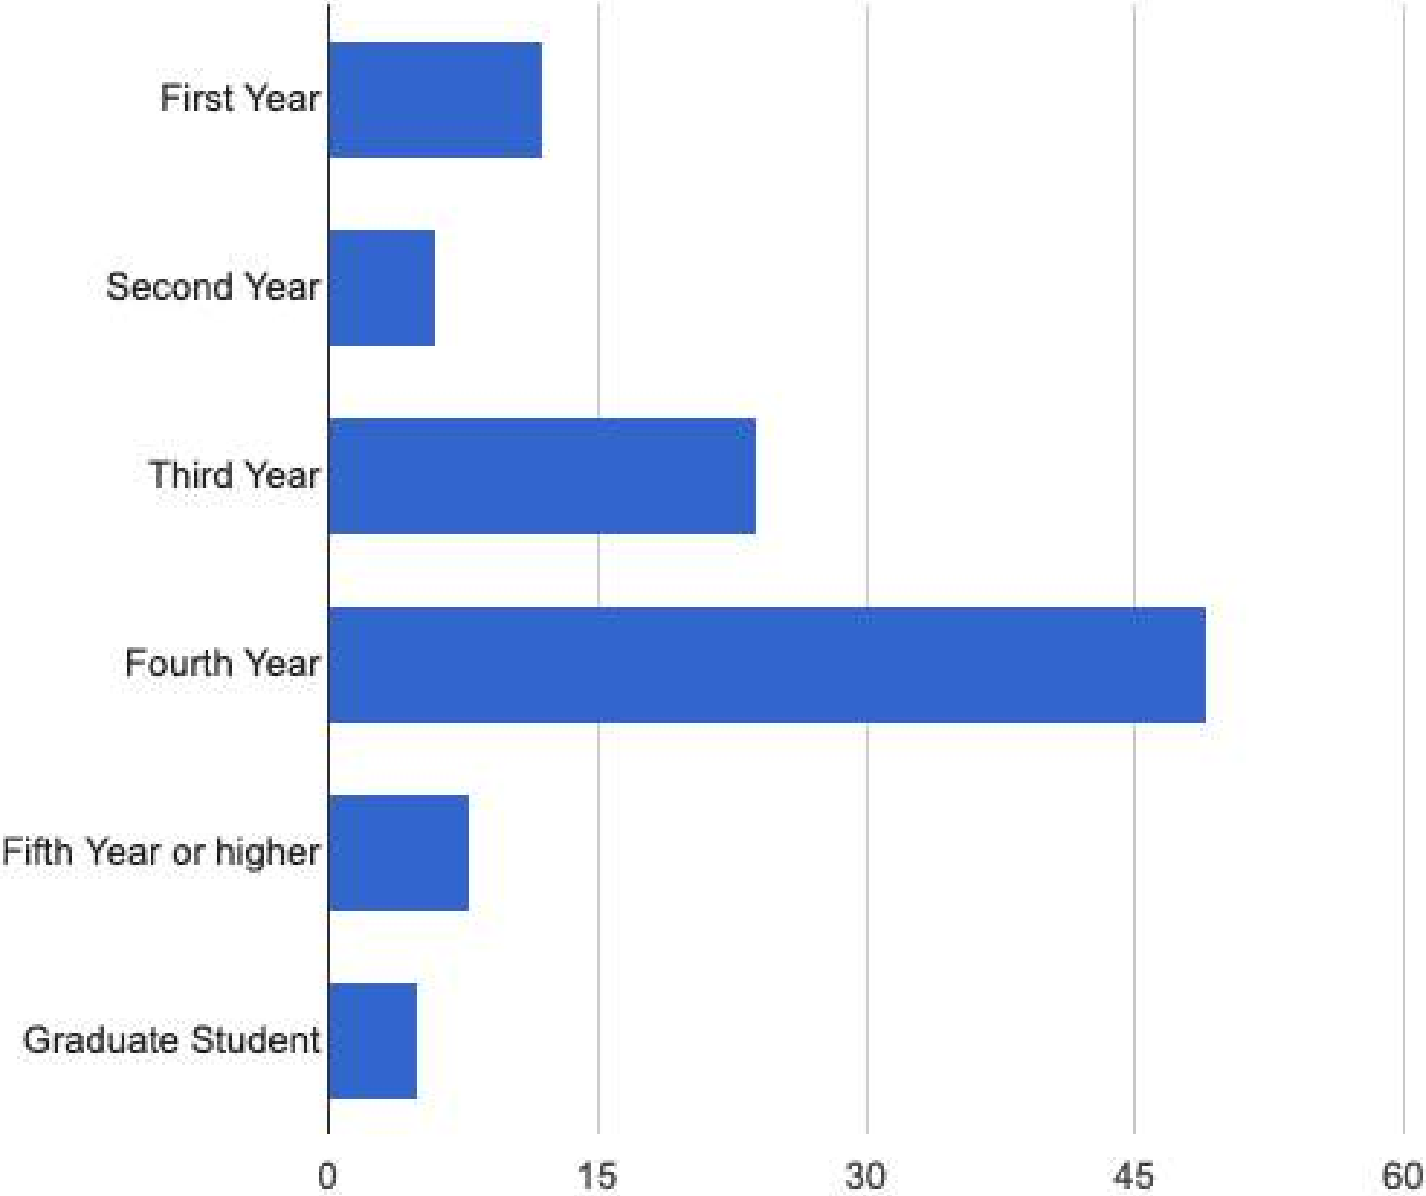

What college are you in at UofT?

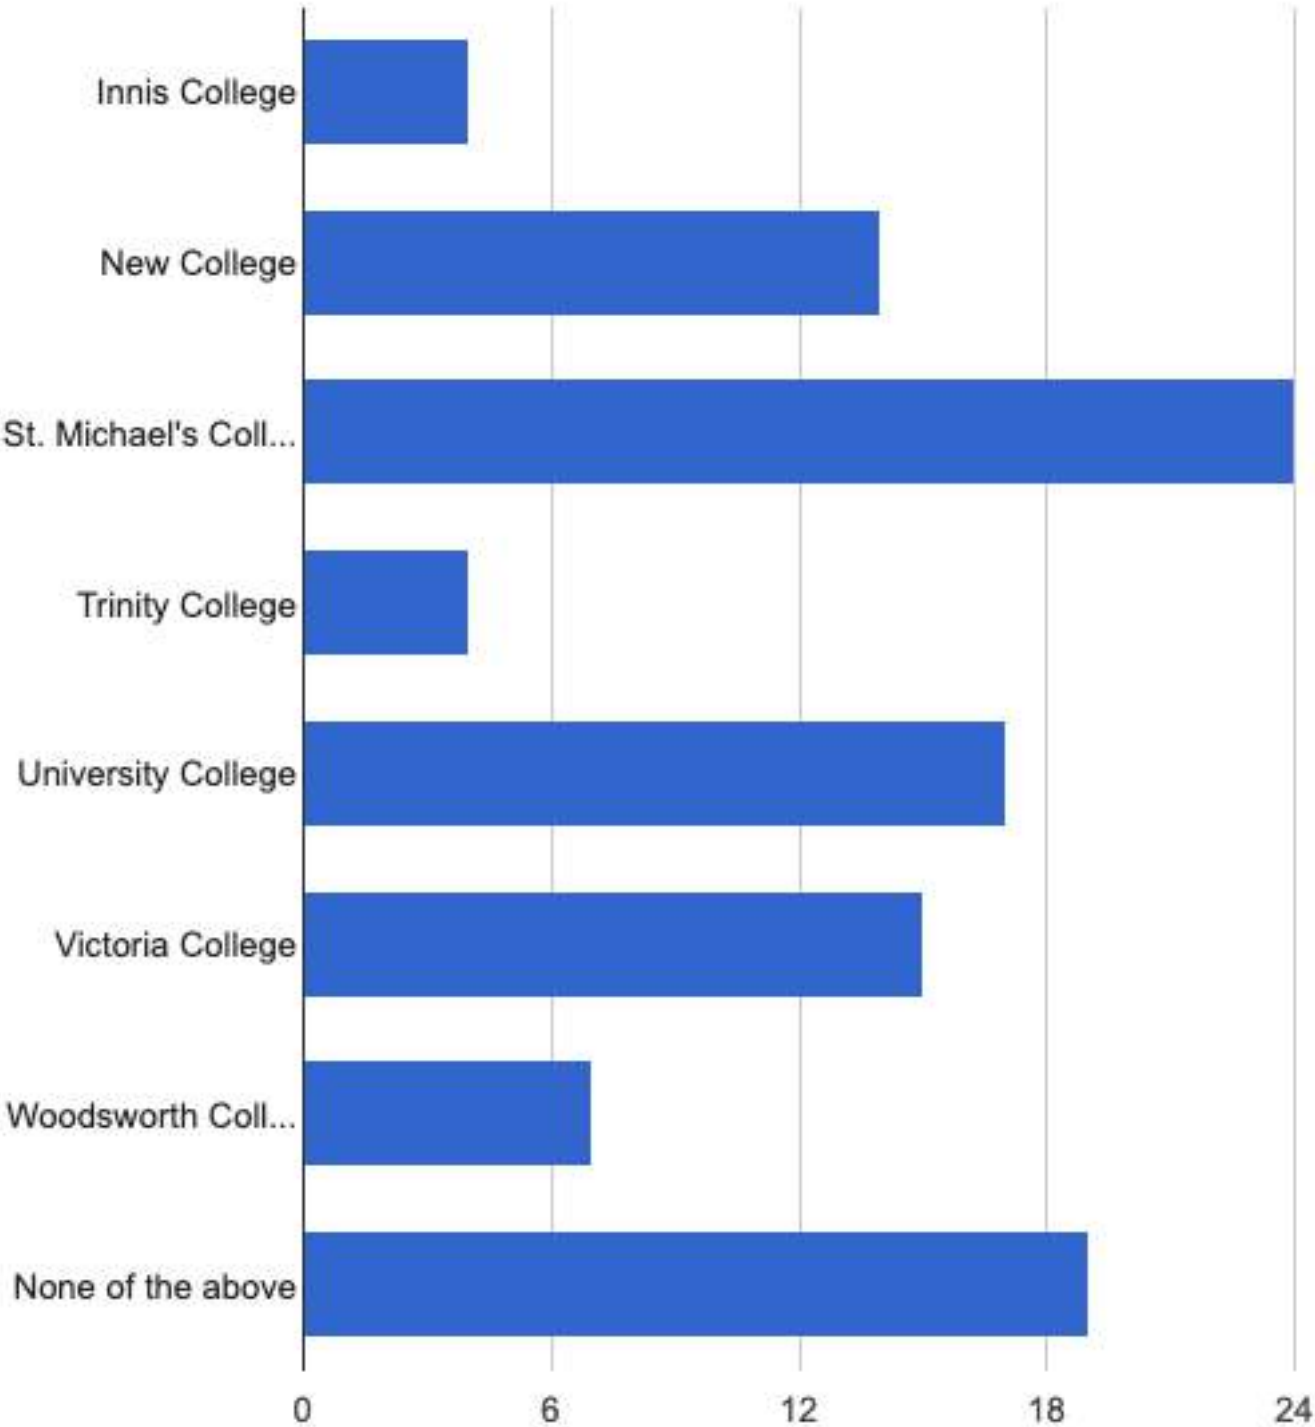

# What year are you in your studies?

# What college are you in at UofT?

# Food Insecurity Screening and Diet

## What does your diet look like?

Within the past 12 months, have you worried that your food would run out before you got money to buy more?

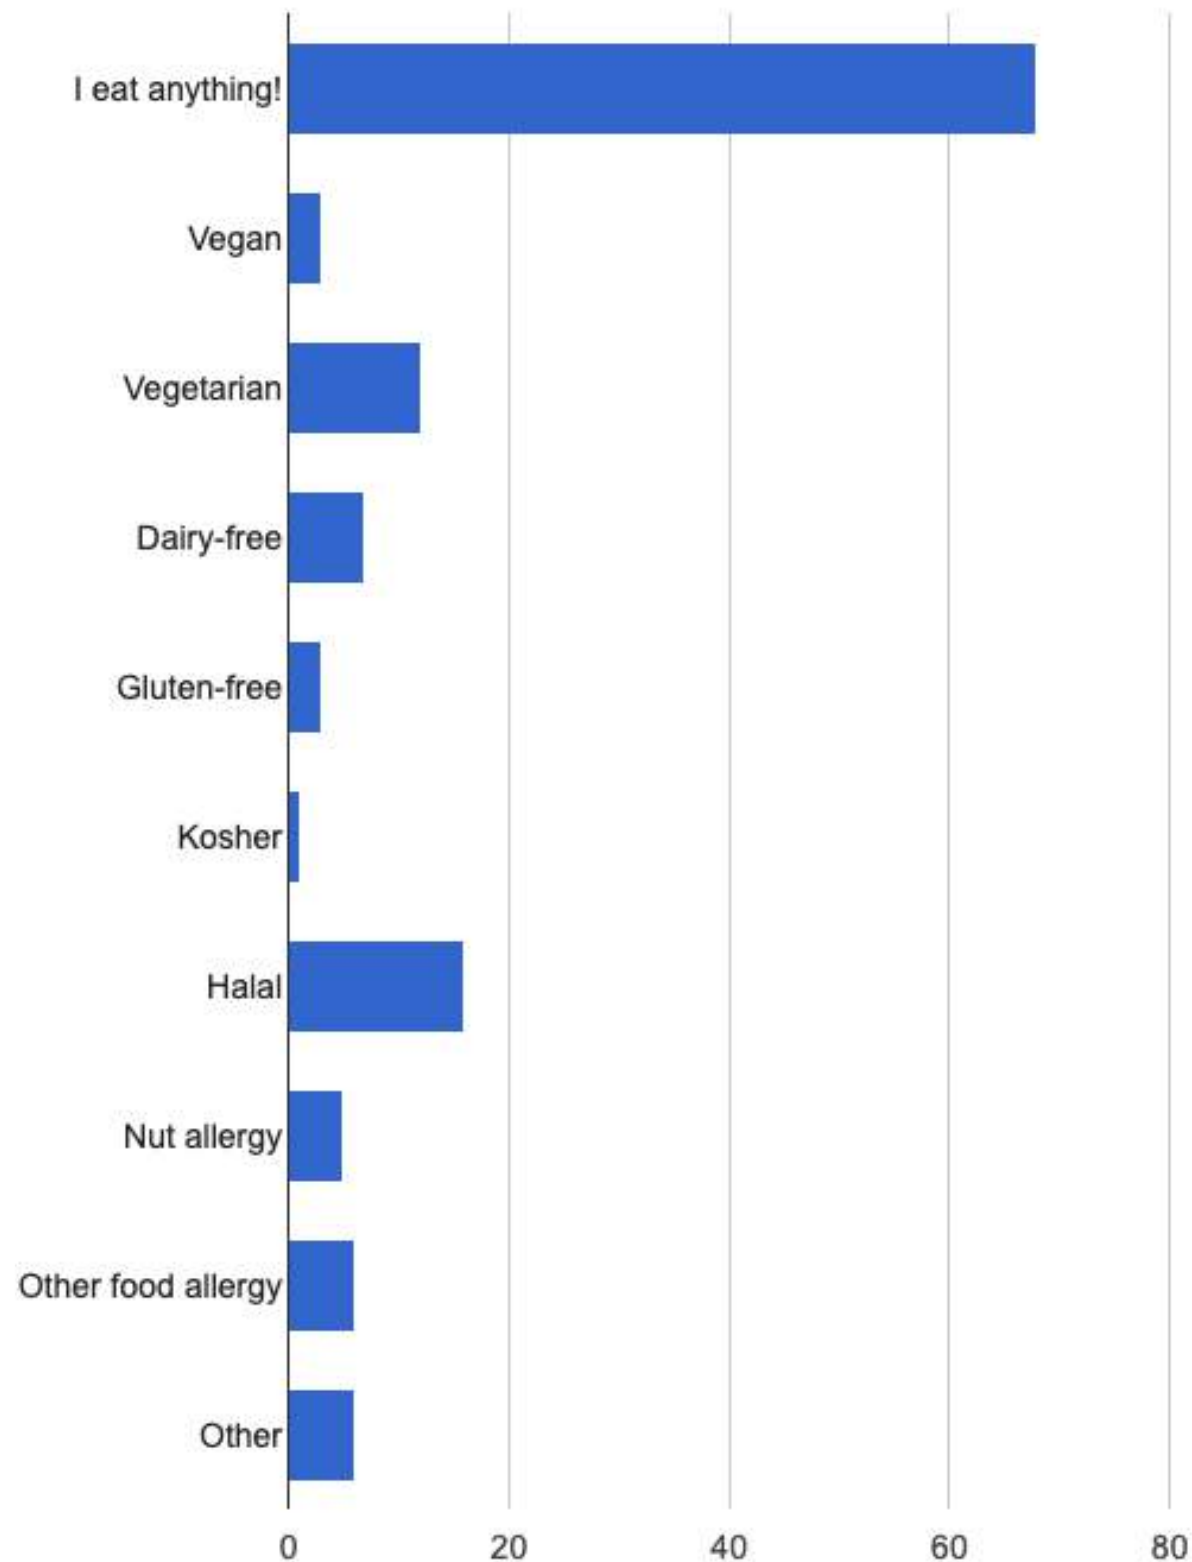

44%

Within the past 12 months, did the food you buy not last and did you not have money to get more?

28%

## *k*-means clustering

🌐 28 languages ▾

From Wikipedia, the free encyclopedia

*Not to be confused with [k-nearest neighbors algorithm](#).*

***k*-means clustering** is a method of [vector quantization](#), originally from [signal processing](#), that aims to [partition](#) *n* observations into *k* clusters in which each observation belongs to the [cluster](#) with the nearest [mean](#) (cluster centers or cluster [centroid](#)), serving as a prototype of the cluster. This results in a partitioning of the data space into [Voronoi cells](#). *k*-means clustering minimizes within-cluster variances ([squared Euclidean distances](#)), but not regular Euclidean distances, which would be the more difficult [Weber problem](#): the mean optimizes squared errors, whereas only the [geometric median](#) minimizes Euclidean distances. For instance, better Euclidean solutions can be found using [k-medians](#) and [k-medoids](#).

The problem is computationally difficult ([NP-hard](#)); however, efficient [heuristic algorithms](#) converge quickly to a [local optimum](#). These are usually similar to the [expectation–maximization algorithm](#) for mixtures of [Gaussian distributions](#) via an

K-Means finds the best centroids by alternating between (1) assigning data points to clusters based on the current centroids (2) choosing centroids (points which are the center of a cluster) based on the current assignment of data points to clusters.

# Feedback on the Fridge

UTSU has  
one on 5th floor  
**always runs out..**

The MealCare fridges are  
**not currently on the  
official campus map**, I  
think it could be worth  
looking into getting the  
fridges added.

It could be helpful to have  
**more frequent postings on  
the Mealcare Instagram**  
about what is currently in  
the fridges, so students know  
what to expect.

I've noticed that the **form** on the meal  
care fridge in the UTSU (and possibly  
other locations) **does not get replaced  
in a timely manner when it is full**, which  
suggests that the **fridges** themselves  
**may not be getting checked often  
enough** by volunteers/folks from the  
meal care community.

# Feedback on the Survey

wouldn't be using these fridges but I know they would be **super helpful** for others who would need them!

There should be a section on this form where you say **if you live with your parents or not**, are a commuter/student living on campus (has access to dining hall)/student living off-campus (has even more reduced access to food).

I think you should include a question about **whether people would like to contribute to a community fridge**, because while I typically do not need to resources I would love to contribute to provide for others.

Is a community fridge referring to something available in a **fully public space** or rather in a dorm or something?

Thank you for Listening
